Project Design Phase-I
Proposed Solution

Date	3 march 2026
Team ID	
Project Name	**"Product Positioning & Sales Performance Analysis"**.
Maximum Marks	2 Marks

Proposed Solution :

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Retail managers struggle to identify how price gaps against competitors and consumer demographics drive sales volume across different seasons due to fragmented data sources.
2.	Idea / Solution description	An interactive Tableau dashboard that integrates product pricing, category metadata, and demographic records to provide real-time visual benchmarking and trend analysis.
3.	Novelty / Uniqueness	Unlike static reports, this solution uses dynamic filtering for **Seasonality** and **Demographics**, allowing users to instantly isolate the "Price Gap" impact on specific high-volume categories like Electronics or Clothing.
4.	Social Impact / Customer Satisfaction	Enables data-driven pricing that can make essential products more accessible to specific demographics, while increasing manager confidence through clear, evidence-based visual insights.
5.	Business Model (Revenue Model)	This tool serves as a Value-Added Service (VAS) for retail enterprises, reducing the manual labor hours spent on data cleaning and competitive research by approximately 60-70%.
6.	Scalability of the Solution	The Tableau architecture is designed to handle increasing data volumes, from small CSV uploads to live connections with enterprise-level SQL databases or cloud storage as the product catalog expands.
